Importance: High

Carolyn – have you had a chance to look at these yet? Some of the highlights of the May 27 report:

- Page 2: it appears that the high temperatures were causing some potential health and safety issues – note that C.2. states that a cone was manufactured to block flying water and debris to protect the drillers
- Page 3: note the average daily removal rates of the SVE system since the deep wells were reconnected ~6,000 to 1,000 lbs/day. According to the 2014 report for the SVE system, it had been recovering ~ 250 lbs/day on average
- Page 9: LNAPL was detected in all the wells that they screened – these appear to all be perimeter SEE wells, it appears that they did not screen interior wells; also see page 15 – pages 9 – 10 of the June 3 report shows that as much as 103 gallons of LNAPL have been removed from these wells
- UWBZ34 it appears was ended where LNAPL was still present in the core (PID reading of 934)
- LSZ50 was ended with LNAPL present
